Python Strings

\ Previous

Next >

Strings

Strings in python are surrounded by either single quotation marks, or double quotation marks.

```
'hello' is the same as "hello".
```

You can display a string literal with the print() function:

Example

```
print("Hello")
print('Hello')
```

Try it Yourself »

Assign String to a Variable

Assigning a string to a variable is done with the variable name followed by an equal sign and the string:

Example

```
a = "Hello"
print(a)

Try it Yourself »
```

Multiline Strings

You can assign a multiline string to a variable by using three quotes:

Example

You can use three double quotes:

```
a = """Lorem ipsum dolor sit amet,
consectetur adipiscing elit,
sed do eiusmod tempor incididunt
ut labore et dolore magna aliqua."""
print(a)
```

Try it Yourself »

Or three single quotes:

Example

```
a = '''Lorem ipsum dolor sit amet,
consectetur adipiscing elit,
sed do eiusmod tempor incididunt
ut labore et dolore magna aliqua.'''
print(a)
```

Try it Yourself »

Note: in the result, the line breaks are inserted at the same position as in the code.

ADVERTISEMENT

Like many other popular programming languages, strings in Python are arrays of bytes representing unicode characters.

However, Python does not have a character data type, a single character is simply a string with a length of 1.

Square brackets can be used to access elements of the string.

Example

Get the character at position 1 (remember that the first character has the position 0):

```
a = "Hello, World!"
print(a[1])
```

Try it Yourself »

Looping Through a String

Since strings are arrays, we can loop through the characters in a string, with a for loop.

Example

Loop through the letters in the word "banana":

```
for x in "banana":
   print(x)

Try it Yourself »
```

Learn more about For Loops in our <u>Python For Loops</u> chapter.

String Length

To get the length of a string, use the len() function.

Example

The len() function returns the length of a string:

```
a = "Hello, World!"
print(len(a))
```

Try it Yourself »

Check String

To check if a certain phrase or character is present in a string, we can use the keyword in.

Example

Check if "free" is present in the following text:

```
txt = "The best things in life are free!"
print("free" in txt)

Try it Yourself »
```

Use it in an if statement:

Example

Print only if "free" is present:

```
txt = "The best things in life are free!"
if "free" in txt:
   print("Yes, 'free' is present.")

Try it Yourself »
```

Learn more about If statements in our <u>Python If...Else</u> chapter.

Check if NOT

To check if a certain phrase or character is NOT present in a string, we can use the keyword not in .

Example

Check if "expensive" is NOT present in the following text:

```
txt = "The best things in life are free!"
print("expensive" not in txt)

Try it Yourself »
```

Use it in an if statement:

Example

print only if "expensive" is NOT present:

```
txt = "The best things in life are free!"
if "expensive" not in txt:
    print("No, 'expensive' is NOT present.")
```
